You do not rise to the level of your goals. You fall to the level of your systems.

We need a tried and proven system to solve coding problems...

P: Understand the **Problem**

E: **Examples** and Test Cases

D: **Data Structures**

A: **Algorithm**

C: **Code**

FizzBuzz

Return an array containing the numbers from 1 to some number N

Replace certain values however if any of the following conditions are met:

- If the value is a multiple of 3: use the value 'Fizz' instead
- If the value is a multiple of 5: use the value 'Buzz' instead
- If the value is a multiple of 3 & 5: use the value 'FizzBuzz' instead

Understand the Problem

- Restate the problem in your own words
- Inputs and Outputs
- Missed requirements and Edge cases
- Develop a mental model for harder problems

Examples and Test Cases

```
fizzbuzz(3) => [1, 2, 'Fizz']
```

```
fizzbuzz(6) => [1, 2, 'Fizz', 4, 'Buzz', 5, 'Fizz']
```

```
fizzbuzz(15) => [1, 2, 'Fizz', 4, 'Buzz', 'Fizz', 7, 8, 'Fizz',  
'Buzz', 11, 'Fizz', 13, 14, 'FizzBuzz']
```

Data Structures

How we keep track of large data

- Arrays
- Objects

Algorithm

- A process or set of rules to be followed in calculations or other problem-solving operations.

Pseudo-code

- A plain language description of the steps in an algorithm or another system.

CODE!
